T75, Rotational speed sensor

T75, Rotational speed sensor

Rotational speed sensor T75 is part of the engine management system and reads the flywheel position. The engine management system receives signals from the rotational speed sensor and estimates the signal strength at different engine speeds. If the signal strength becomes too low, a fault code is generated.

Engine speed

If the engine has more than one engine speed sensors, the engine control unit selects one of them and reads only its signal. Therefore, only one engine speed is displayed at any time.
